

Turn on GenIE 2

Step 1: Turn on devices in the room

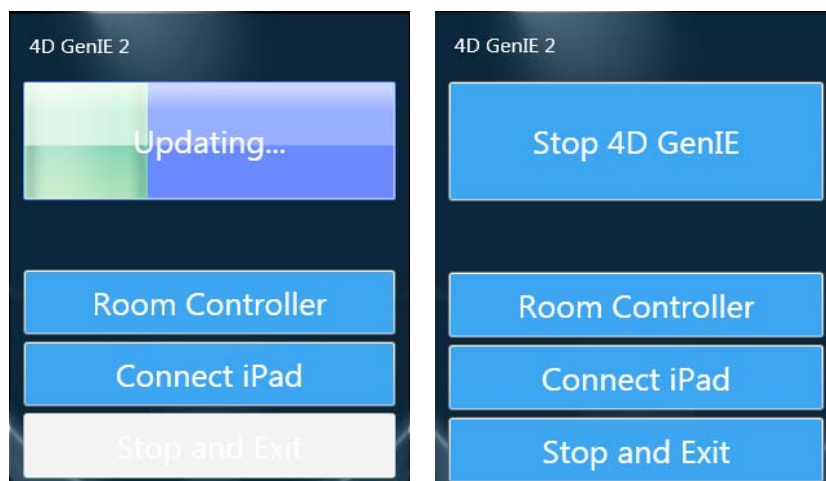

Switch on your PC which has GenIE 2 installed. Turn on all other devices like projectors, lights, and speakers (alternatively, projectors and lights can be turned on using GenIE 2 - see Step 3).

Step 2: Start the GenIE 2 software

Double click on the GenIE 2 icon (see image below) located on your desktop screen.

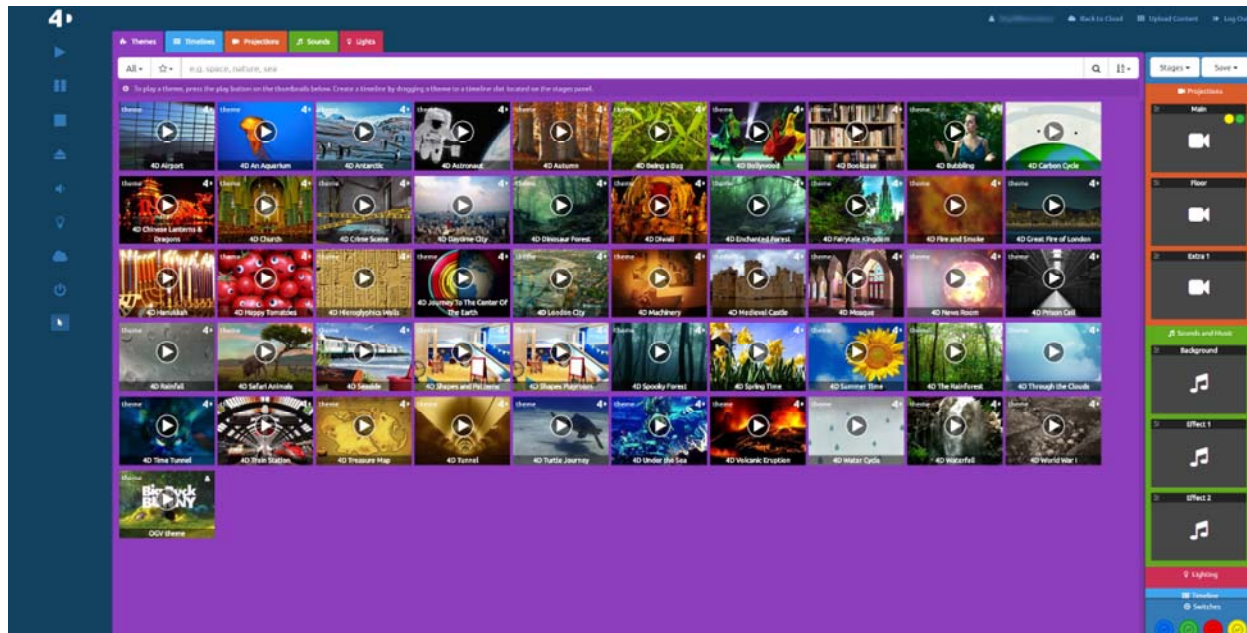

This will load the GenIE 2 launcher, and update the system (see image below). Once it has updated, you should see a **Stop 4D GenIE** button at the top (see image below on the right).

Press on **Room Controller**

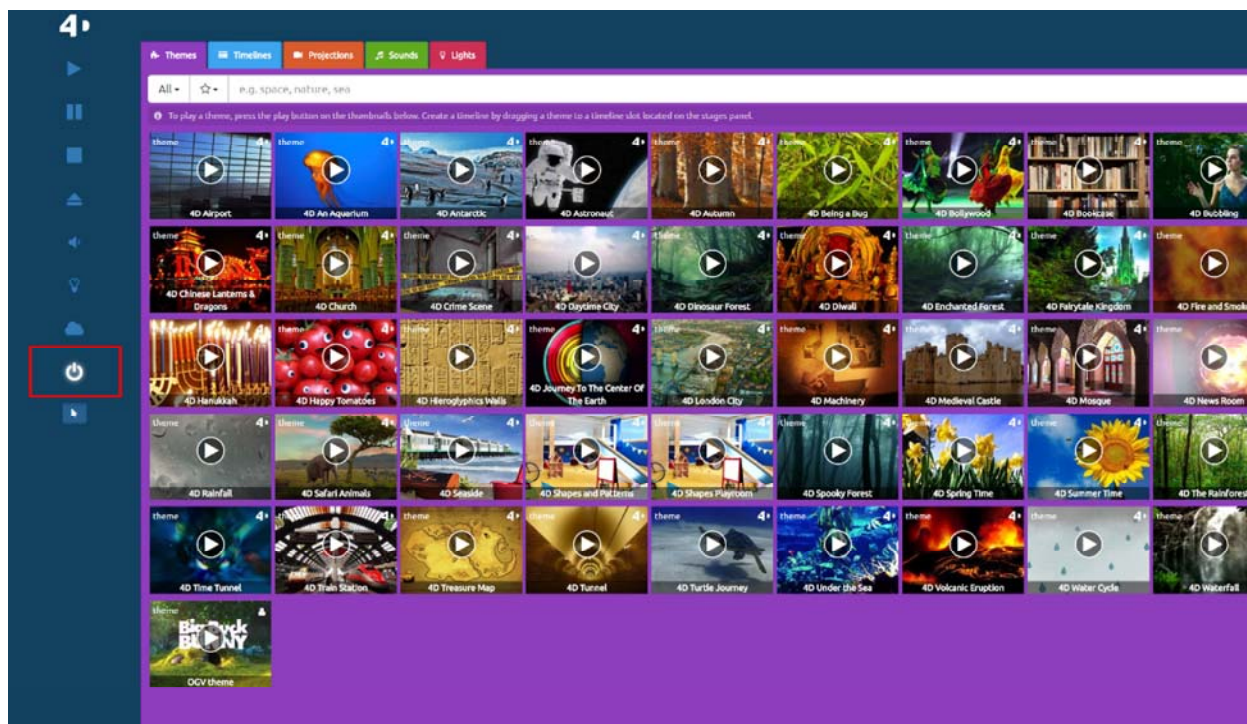

If you **have** an internet connection you will be asked to login, giving you access to your personal content and private content groups

If you **don't have** an internet connection you will be directed to the offline room controller, this only gives you access to public content.

Step 3: Switch on projectors using the GenIE 2 room controller

The GenIE 2 room controller allows you to switch on the projectors (given that they are plugged in and connected with an ethernet cable). Press the power button located on the left hand side.

Then press **Turn on projectors** once the power dialog comes up.
